Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an innertion close to or within gene Ar2g34400.

Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated http://www.mpiz-koeln.mpg.de/GABI-Kat/.

The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed."

                                    This ribozyme cleaves substrate SP1.1 (see AAS57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3 -UNNXNN -5. The substrate of the enzyme has the sequence 5 - H *GNNHNN-3. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3 'to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme of the substrate sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                                                                                                                                              sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                1..6

                                                                                               This is the nucleotide sequence of ribozyme deltaRzPl.1. This ribozyme cleaves substrate SPl.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzPl.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nuclectides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave irral RNA or RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a

This is the nucleotide sequence of a trans-acting antigenomic delta ribozyme of the invention. This ribozyme cleaves substrate SP1.1 (see AAZS7641). The invention. This ribozyme cleaves substrate SP1.1 (see deltaizel.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GANNIN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides by '). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           enzymes also have other therapeutīc, biotechnological and diagnostic applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      therapeuric, biotechnological and diagnostic applications. Note: This sequence is not shown in the specification, but has been derived from the deltaRzP1.1 sequence (AAS57636) shown in figure 1
                                                                                                                                                                     cleaves substrate SPI.2 (see ARZ57634). The invention relates to a nucleic acid enzyme (e.g. deltaRzPi.2) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNAIN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7. .19

A lambda gt cDNA library was prepared from human liver mRNA. The library was screened with iodine-125 labelled antibody to human protein C. A cDNA which lacked the coding sequence for the pre-pro peptide and the forst 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human protein C or activated protein C - prepd. using expression vector capable of integration in mammalian host cell DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exon
 ö
                                                                                                                                                                                                                                          Protein C DNA coding sequence and expression vector for prodn. - used for treating blood coagulation disorders.
                                                                                                                                                                                                                                                                                                       In the construction of the full length protein C gene this sequence the introns removed then is joined to a cDNA clone. The desired genomic:cDNA is then generated by looping out of unwanted sequences using oligonuclectide-directed deletion mutagenesis. The protein produced upon transformation of mammalian host cells, contg. the recombinant DNA, has substantially the same biological activity as natural protein C and is hence useful in the treatment of blood coagulation disorders. (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and protective activities, and can be used in gene therapy. (I) and protectins (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptide nucleic acids, mimetries, peptides, proteins, agonists, antagonists, antibodies or their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            developmental process, treatment, condition, disease or disorder. The gene profile can be used for disgnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology
amino acids of protein C was isolated and used as a hybridisation probe. The remainder of the coding sequence was obtained from a human genomic DNA library in lambda Charon 4A. Recombinantly produced protein C can be used to treat thrombotic disorders such as venous thrombosis. (Updated or 25-WAR-2003 to correct PA field.)

                                                                                                                                       A genomic DNA fragment (AAT12796) codes for human full-length protein C (AAW02600), a zymogen of a serine protease that plays an important role in blood clotting and in the generation of fibrinolytic activity in vivo. It was obtd. from a human genomic library in phage Charon 4A using a partial cDNA clone as probe. A complete cDNA clone (AAT12795) was also produced. Protein C-encoding nucleic acids can be used for large-scale prodn. of protein C, or variants modified to improve cleavage between the heavy and light chains of the circulating intermediate. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                         New DNA encoding modified forms of opt. activated protein C - and related transformed cells for prodn. of recombinant protein C for use e.g. as an

This DNA sequence comprises human genomic DNA encoding protein C (AAW25086). A claimed method for producing human protein C in the milk of a transgenic animal involves: (a) providing a DNA construct comprising DNA encoding a secretion signal and a protein C propeptide, operably linked to DNA encoding two chain cleavage site-modified protein C, the 2 DNA sequences being linked to elements required for protein C expression in a mammary gland of a host female animal, esp. the beta-lactoglobulin gene promoter (see AAT79725); and (b) using the DNA construct to breed a transgenic animal (esp. abeby, rabbit, cattle, goat) that produces protein C in its milk, at least 90% of the protein C being in the two-chain form. Modification of the protein C two-chain cleavage site (see AAW25085) improves the maturation of recombinant protein C from aingle chain to two-chain form. Also claimed is a non-human mammalian embryo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Production of protein C in transgenic animal - useful for high quantity protein C production with therapeutic value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, coding sequence polymorphism, vascular pathology gene; polymorphic site; phenotype correlation; forensic; paternity testing; medicine; genetic analysis; vascular disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

AAZ32159 to AAZ32194 represent reference alleles for specifically claimed nucleic acid sequences from the present invention which comprise polymorphic sites as given in a table in the specification, selected from 92 single nucleotide polymorphisms in which the nucleotide at the polymorphic site is different from a nucleotide at the same site in a reference allele. The nucleic acids, and primers and probes, are used to identify polymorphisms, which may predispose an individual to disease, especially a vascular disease. They can also be used in phenotype correlations, forensics, paternity testing, medicine or genetic analysis.

AAY49550 to AAY49573 represent the proteins which correspond to some of
                                                                                                                                                                                                                                                              Determination of polymorphisms in genes, especially those identifying

The invention relates to muclate acts sequences which regulate gene carperesion in an age-related manner and/or in a liver-specific manner. The invention identifies regions of the human factor IX (hFIX) gene, and a region of the human protein (hFO) gene, which are age-related regulatory sequences are fegulatory sequences. The hFIX age-related regulatory sequences are fegulatory sequences. The hFIX age-related regulatory sequences are fesignated AES: (AAF54016) and AE3: (AAF54018) and 3 UTR (at position 13483-60 AAF54018) and 3 UTR (at position 13483-60 AAF54018) respectively. These elements act sprengistically to increase hFIX levels over the lifespan of an individual; however, they can independently exert effects on hFIX mRNA, and AE3' acting to stabilise hFIX mRNA, and AE3' acting to increase hFIX mRNA levels, over time. AE5' also directs liver-specific expression. The hFI APE5' acting to stabilise hFIX mRNA, and AE3' acting to increase hFIX mRNA levels, over time. AE5' also directs liver-specific expression. The hIV of gene age-related regulatory sequence is found in the 5' UTR (AAF54081), and contains two PEA-3 (PO)Voma virus activator 3) elements of 'GAGGAAA-3' and 5'-GAGGAAG-3' The age-related regulatory sequences of the invention, along with their homologues, variants and fragments, may be used in the construction of recombinant expression vectors for the pro-coagulants factor IX promoter include those encoding proteins such as luciferase. CC and the SEA protein and reporter proteins such as luciferase. CC and the SEA protein and reporter proteins such as luciferase. The expression vectors of the invention may be used in dene therapy to provide age-related and/or liver-specific expression of target genes. Age-regulatable constructs may be used in the treatment of such age-related conditions such as thrombosis, cardiovascular conditions as seociated with the natural age-related and/or liver-repease conditions as especiated with the natural age-related by the propers of the propers of the properses factor 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     regulatory sequences, are useful as probes to detect, isolate or identify other such sequences in samples. The present sequence represents CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; protein C; single nucleotide polymorphism; SNP; inflammation; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression. Transgenic cells or animals that contain vectors of the invention are useful as models of these diseases, in screening for potential therapeutic agents and for studying normal processes such ageing and gene expression. The present invention relates to a method of obtaining a prognosis for a patient having or at risk of developing an inflammatory condition, which comprises determining a genotype including one or more polymorphism sites in the protein C gene for the patient, where the genotype is indicative of an ability of the patient to recover from an inflammatory condition. The method is useful in obtaining a prognosis for a patient having or at risk of developing an inflammatory condition. Inflammatory condition is selected from sepsis, septicemia, pneumonia, septic shock, Acute Respiratory Distress Syndrome (ARDS), acute lung injury, infection, pancreatitis, bactersemia, peritonitis, abdominal, abscess, inflammation due to trauma or surgery, chronic inflammatory disease, ischaemia, inschaemia, peritonitis and reactions to ingested, inflammation chemotherapy or radiotherapy and reactions to ingested, inhaled, infused, injected or delivered substances, preferably systemic inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Obtaining a prognosis for a patient having or at risk of developing an inflammatory condition, e.g. systemic inflammatory response syndrome by determining protein C polymorphism.

The invention relates to 87 isolated NOVX polypeptides (NOV1-NOV5), their mature forms and their encoding polynucleotides having sequence candinatity to pancreatic polypeptide (NOV2), endozepine (NOV2), interleukin-1 (NOV3), endothelin-2 (NOV4), endozepine (NOV5), and the mannifacture of a medicament for treating a human disease associated with NOVX, detecting NOVX in a sample via an immunoassay, identifying an agent that binds to the NOVX polypeptide, a cell comprising the activity of NOVX, a vector comprising NOVX polypeptide, a cell comprising the polymucleotide in a sample using a hybridisation a cell comprising the polymucleotide in a sample using hybridisation a cell comprising the polymucleotide in a sample using hybridisation conditions that lead to expression of the polypeptide. NOVX and its polymucleotide are used to prevent, diagnose or treat a medical condition to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX conditions that lead to sexpression of the polypeptides. Altheimer's disease, anorexia, cancer, cancer, diabetes, obesity, infectious disease, anorexia, cancer, cancer associated cachexia, neurodegenerative diseases, anorexia, cancer, cancer associated cachexia, neurodegenerative construction diseases, mand disease, mand disease, mand disease, anorexia, cancer associated with obesity, the metabolic syndrome X and disease, mating diseases associated with obesity, the metabolic syndrome X and metabolic diseases associated with obesity, the metabolic syndrome X and metabolic and provention of the polypeptides cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               They may also be used as antibacterial agents. NOVX may also be used as an antigen in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The present sequence encodes a NOVX protein.

(CURA-) CURAGEN CORP.

New NOVX polypeptides and nucleic acids for diagnosing, preventing or treating NOVX-associated disorders, e.g. cancer, obesity, diabetes or atherosclerosis, and for chromosome mapping, tissue typing or pharmacogenomics.

Claim 20; SEQ ID NO 167; 112pp; English.

The present invention describes novel human proteins designated NOVX, where X can be an integer of 1 to 7. The NOVX protein and nucleotide where X can be an integer of 1 to 7. The NOVX protein and nucleotide sequences have cytosfatic, anorectic, antidabetic, antiparkinsonian, neuroprotective, nootropic, immunoadulator, antiarteriosolerotic.

C nephrotropic and osteopathic activities, and can be used in wandfacturing a medicament for treating a syndrome associated with a human disease, the disease selected from a pathology associated with the protein. The disease selected from a pathology associated with the protein. The c disease can be used for diagnosing, treating or preventing other antibodies may also be used for diagnosing, treating or preventing other pathologies associated with abernant NOVX expression or activity, such as obssity, diabetes, metabolic disorders, anorexia, neurodegenerative c diseases (e.g. Parkinson's disease, anorexia, neurodegenerative c disorders, haematopoietic disorders, atherosclerosis, renal failure, NoVX nucleic acids and proteins may also be used in chromosome mapping, tissue typing, predictive medicine and pharmacogenomics. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for detecting soft tissue sarcoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which comparises obtaining a first soft tissue sample from a individual determining the expression of a gene in both sample from a individual determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has sylvastic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 135005 BP; 32951 A; 33605 C; 32661 G; 35788 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|q192114|gb|APL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

Coli strain XL10-Gold, T1-resistant, F-" | Jeab_host="Rector: PWDADIN; Purified genomic DNA from M. | Musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource | Musculus C57BL/6J (male) was obtained from the Jackson | Laboratory Mouse DNA Resource | Musculus C57BL/6J (male) was blunced from constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with TA DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of phasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (stratagene) cells and selected for ampicillin resistance."

normalized libraries (melanocyte 2NDHM, pregnant uterus NDHPU, and fetal heart NDHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5.00 clones made from the same 3 libraries. The pools consisted of I.M.A.G.B. clones 260232-265223,

Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web selte 'www.zmdb.iastete.edu' and follow the links for 'RescueMu'. Grid L was grown in Molokai in 2001. DNA was extracted from leaf strips, double digested using BamHI and Bill, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EST 06-JUL-1995

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoreasis. Vector DNA was prepared from a derivative of pWD42 (gil 4732114 gb) Har129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptore complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            45 Dp mRNA linear EST 17-JAN-2002 50072-2-7-F09.r.1 Chilcoat/Turkewitz cDNA (large fraction) Tetrahymena thermophila cDNA, mRNA sequence.

Direct Submission Trypanosoma brucei genome sequencing
submitted (10-DEC-2000) Trypanosoma brucei genome Campus, Hinxton,
Cambridge CB10 15A, E-mail: barrell@sanger.ac.uk and
nl@sanger.ac.uk
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAt 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
/lab host="DH10B"
/clone=11b="Soarse testis_NHT"
/clone=12b="Soarse testis_NHT"
/note=12betor: pryT3D-Pac (Pharmacia) with a modified
polylinker; Site_1: Not I; Site_2: Eco RI; 1st strand cDNA
was prepared from mRNA obtained from Clontech
Laboratories, Inc., and primed with a Not I - oligo(dT)
primer [5'
                                                                                                                                                                                                                                                         Double-stranded CDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Econed into the Not I and Eco RI sites of the modified pi773 vector. Library went through one round of normalization to Cot5, and was constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TA234D12P 55 bp DNA linear GSS 13-DEC-2000
T. brucei sheared genomic DNA clone 234d12, forward sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bmail: nelsayed@tigr.org

/note="Wector: TOOPPCR4; DNA flanking Mu transposon insertions in Mu inactive lines were extracted from the UniformMu maize population by the thermo assymmetric interlaced PCR (TAIL) protocol using primers specific for the Mu terminal inverted repeat and a set of 16 arbitrary primers. Amplicons were size enriched using Sepharose 400 spin columns and cloned into the TOPO PCR4 vector."
                                                                                                                                                                                                                                                                                                                                       Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnoliophyta, Liliopsida, Poales, Poaceae, PACCAD clade, Panicoideae, Andropogoneae, Zea.
